

Tiene gran mancha roja. *es el quinto en el sistema solar*

JÚPITER *es 7785 millon km*

es le más grande *by melisa,iremau and vyera*

su temperatura es de 24,000 grados

Este planeta se llama Mercurio. *Es el primer en el sistema solar.*

Mercurio es más pequeño que Saturno *Es el más caliente que la tierra*

Es el planeta más pequeño! *Es lo más cercano al sol.*

BY- Tula and Amarisse

Mercurio es 2440 km

Su temperatura es de menos 173 grados y 427 grados!

People in Space

The idea of living in Space is Amazing! But what would it be like and how many years would it take. In this report you will find out all the wonders you have wondered and what the ISS does.

Training to be an astronaut

Astronauts need to train before entering Space and this whole process takes 10 long years. They are tested on agility, strength, balance and aiming. One way this is done is by rehearsing in orbit activities. To get a feeling of floating astronauts walk at the bottom of a swimming pool. If a human space mission is to be a success astronauts must be familiar with every aspect of the spacecraft operations.

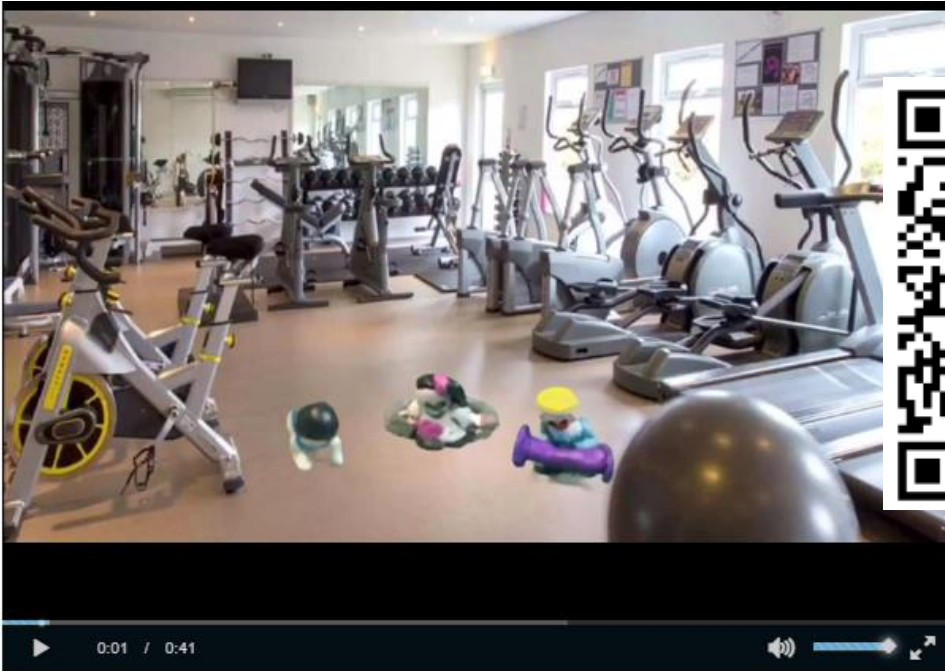

The ISS

The ISS is short for international space station. It is a large space craft that orbits the earth, it serves as a home of crews of astronauts live. It was launched 20 years ago and it travels around around the earth 60 times per day.

Jupiter top trump

Diameter: 139,822km
 Distance from sun: 778.5 million km
 Number of moons: 69
 Average temperature: -145 degrees c
 Length of a year: 12 earth years
